# Plug-in Type Digital Indicating Conductivity Meter WIL-102-ECH (High Concentration)

### **Instruction Manual**

## Preface

Thank you for purchasing our WIL-102-ECH (High Concentration), Plug-in Type Digital Indicating Conductivity Meter.

This manual contains instructions for the mounting, functions, operations and notes when operating the WIL-102-ECH. To ensure safe and correct use, thoroughly read and understand this manual before using this instrument. To prevent accidents arising from the misuse of this instrument, please ensure the operator receives this manual.

Indication	4		1	2	Ē	Ч	มา	5	7	8	9	Ľ	F

#### Characters Used in This Manual

# ⚠ Caution

- This instrument should be used in accordance with the specifications described in the manual. If it is not used according to the specifications, it may malfunction or cause a fire.
- Be sure to follow all of the warnings, cautions and notices. If they are not observed, serious injury or malfunction may occur.
- The contents of this instruction manual are subject to change without notice.
- Care has been taken to ensure that the contents of this instruction manual are correct, but if there are any doubts, mistakes or questions, please inform our sales department.
- This instrument is designed to be installed on a DIN rail within a control panel. If it is not, measures must be taken to ensure that the operator cannot touch power terminals or other high voltage sections.
- Any unauthorized transfer or copying of this document, in part or in whole, is prohibited.
- Shinko Technos CO., LTD. is not liable for any damage or secondary damage(s) incurred as a result of using this product, including any indirect damage.

### Safety Precautions (Be sure to read these precautions before using our products.)

The safety precautions are classified into 2 categories: "Warning" and "Caution". Depending on the circumstances, procedures indicated by  $\triangle$  Caution may result in serious consequences, so be sure to follow the directions for usage.

Procedures which may lead to dangerous conditions and cause death or serious injury, if not carried out properly.

Procedures which may lead to dangerous conditions and cause superficial to medium injury or physical damage or may degrade or damage the product, if not carried out properly.

## 🛛 Warning

- To prevent an electrical shock or fire, only Shinko or other qualified service personnel may handle the inner assembly.
- To prevent an electrical shock, fire or damage to the instrument, parts replacement may only be undertaken by Shinko or other qualified service personnel.

## A SAFETY PRECAUTIONS

- To ensure safe and correct use, thoroughly read and understand this manual before using this instrument.
- This instrument is intended to be used for measuring equipment. Verify correct usage after purpose-of-use consultation with our agency or main office. (Never use this instrument for medical purposes with which human lives are involved.)
- External protection devices such as protective equipment against excessive temperature rise, etc. must be installed, as malfunction of this product could result in serious damage to the system or injury to personnel. Proper periodic maintenance is also required.
- This instrument must be used under the conditions and environment described in this manual. Shinko Technos Co., Ltd. does not accept liability for any injury, loss of life or damage occurring due to the instrument being used under conditions not otherwise stated in this manual.

### **1** Caution with Respect to Export Trade Control Ordinance

To avoid this instrument from being used as a component in, or as being utilized in the manufacture of weapons of mass destruction (i.e. military applications, military equipment, etc.), please investigate the end users and the final use of this instrument. In the case of resale, ensure that this instrument is not illegally exported.

## PRECAUTIONS

### 1. Installation Precautions

### 1 Caution

This instrument is intended to be used under the following environmental conditions (IEC61010-1): • Overvoltage category II, Pollution degree 2

Ensure the mounting location corresponds to the following conditions:

- A minimum of dust, and an absence of corrosive gases
- No flammable, explosive gases
- No mechanical vibrations or shocks
- No exposure to direct sunlight, an ambient temperature of 0 to 50  $^\circ C$  (32 to 122  $^\circ F$ ) that does not change rapidly, and no icing
- An ambient non-condensing humidity of 35 to 85 %RH
- No large capacity electromagnetic switches or cables through which large current is flowing
- No water, oil, chemicals or the vapors of these substances can come into direct contact with the unit
- If the WIL-102-ECH is installed within a control panel, the ambient temperature of the unit not the ambient temperature of the control panel must be kept under 50°C. Otherwise the life of electronic parts (especially electrolytic capacitors) of the unit will be shortened.

## Note: Do not install this instrument on or near flammable material even though the case of this instrument is made of flame-resistant resin.

### 2. Wiring Precautions

## Caution

- Do not leave wire remnants in the instrument, as they could cause a fire and/or a malfunction.
- Use a solderless terminal with an insulation sleeve in which the M3 screw fits when wiring the WIL-102-ECH.
- Tighten the terminal screw using the specified torque. If excessive force is applied to the screw when tightening, the terminal screw may be damaged.
- This instrument does not have a built-in power switch, circuit breaker and fuse. It is necessary to install a power switch, circuit breaker and fuse near the instrument. (Recommended fuse: Time-lag fuse, rated voltage 250 V AC, rated current 2 A)
- For a 24 V AC/DC power source, do not confuse polarity when using direct current (DC).
- Do not apply a commercial power source to the sensor which is connected to the input terminal nor allow the power source to come into contact with the sensor.
- Use the 4-electrode Conductivity Sensor in accordance with the sensor input specifications of the WIL-102-ECH.
- Keep the input wires and power lines separate.

#### Note about the 4-Electrode Conductivity Sensor Cable

- The 4-electrode Conductivity Sensor cable is a highly-insulated (electrical) cable. Please handle it with utmost care as follows.
- Do not allow terminals and socket of the 4-electrode Conductivity Sensor cable to come in contact with moisture or oil of any kind. Likewise, ensure fingers are clean, otherwise the insulation will deteriorate, resulting in unstable indication.

Be sure to keep the cable dry and clean at all times.

- If the cable is stained, clean it with alcohol, and dry it completely.
- For calibration or electrode checking/replacement, the 4-electrode Conductivity Sensor cable should be wired with sufficient length.
- Keep the 4-electrode Conductivity Sensor cable and junction cable away from electrical devices, such as motors or their power lines from which inductive interference emanates.

#### Connection

The 4-electrode Conductivity Sensor cable has the following terminals.

Code	Terminal
1	Conductivity sensor terminal 1
2	Conductivity sensor terminal 2
3	Conductivity sensor terminal 3
4	Conductivity sensor terminal 4
A, B (T, T)	Temperature compensation sensor terminals [Pt100 (2-wire), Pt1000] 5-6
A, B, B	Temperature compensation sensor terminals [Pt100 (3-wire)] 5-6-7
E	Shield wire terminal 8

For the electrode with no temperature compensation, A, B (T, T) or A, B, B cables are not available. E cables are available depending on the sensor type.

During operation, the Conductivity/Temperature Display may become abnormal or unstable due to inductive interference or noise. In this case, try [Grounding of shield wire terminal (E) (P.77)].

#### 3. Operation and Maintenance Precautions

## 1 Caution

- Do not touch live terminals. This may cause an electrical shock or problems in operation.
- Turn the power supply to the instrument OFF when retightening the terminal or cleaning. Working on or touching the terminal with the power switched ON may result in severe injury or death due to electrical shock.
- Use a soft, dry cloth when cleaning the instrument. (Alcohol based substances may tarnish or deface the unit.)
- As the display section is vulnerable, be careful not to put pressure on, scratch or strike it with a hard object.

## 1. Model

#### 1.1 Model

WIL-10	2	-EC	Н		, 🗆 🗆	
Input Points	2					2 points
						4-electrode Conductivity Sensor
Innut		EC				(Temperature element: Pt100) (*1)
Input		EC				4-electrode Conductivity Sensor
						(Temperature element: Pt1000) (*1)
Concentration H				High concentration		
Dower Supply					100 to 240 V AC (standard)	
Power Supply	/ 00	lage		1		24 V AC/DC (*2)
				EVT	A output (A11, A12, A21, A22)	
Option			TA	Transmission output 1 (*3)		
		TA2	Transmission output 1, Transmission output 2			

(\*1) This input temperature specification was specified at the time of ordering.

(\*2) Power supply voltage 100 to 240 V AC is standard.

When ordering 24 V AC/DC, enter "1" in Power supply voltage after 'ECH'.

(\*3) If TA option is ordered, the EVT option (A1 output only) will be added.

#### 1.2 How to Read the Model Label

The model label is attached to the left side of the case.

### 2. Names and Functions of Instrument

#### Displays

<b>Conductivity Display</b> Conductivity, or characters in setting mode are indicated in red.		
(CH1)	Indications differ depending on the selections in [Display selection (p.34)].	
<b>Temperature Display</b> Temperature, or values in setting mode are indicated in red.		
(CH2)	Indications differ depending on the selections in [Display selection (p.34)].	

Unit label (CH1)	Attach the user's unit of Conductivity Display (CH1) from the included unit			
	labels if necessary.			
Unit label (CH2)	Attach the user's unit of Temperature Display (CH2) from the included unit labels if necessary.			

#### **Action Indicators**

PWR Indicator	When power supply to the instrument is turned ON, the yellow LED lights.	
A1 Indicator	When A1 output (Contact output 1) is ON, the red LED lights.	
	(Unlit if TA2 option is ordered.)	
A2 Indicator	When A2 output (Contact output 2) is ON, the yellow LED lights.	
	(Unlit if TA option or TA2 option is ordered.)	
T/R Indicator	The yellow LED lights during Serial communication TX output (transmitting).	

Key

UP key	Increases the numeric value.		
DOWN key	ey Decreases the numeric value.		
I MODE key	Selects a setting group.		
SET/RESET key	Switches the setting modes, and registers the set value.		

Light Sensor	Automatically measures and controls brightness of the Conductivity Display,
	Temperature Display and Action indicators.

### **▲** Notice

When setting the specifications and functions of this instrument, connect mains power cable to terminals 13 and 14 first, then set them referring from "6. Outline of Key Operation and Setting Groups" to "8. Setup (pp.16 to 38)" before performing "3. Mounting to the Control Panel (p.9)" and "5. Wiring (p.12)".

## 3. Mounting to the Control Panel

#### 3.1 Site Selection

### ▲ Caution

Use within the following temperature and humidity ranges.

Temperature: 0 to  $50^{\circ}$ C (32 to  $122^{\circ}$ F) (No icing), Humidity: 35 to 85 %RH (Non-condensing) If the WIL-102-ECH is installed within a control panel, the ambient temperature of the unit – not the ambient temperature of the control panel – must be kept under  $50^{\circ}$ C. Otherwise the life of electronic parts (especially electrolytic capacitors) of the unit will be shortened.

## This instrument is intended to be used under the following environmental conditions (IEC61010-1): Overvoltage category II, Pollution degree 2

Ensure the mounting location corresponds to the following conditions:

- A minimum of dust, and an absence of corrosive gases
- No flammable, explosive gases
- No mechanical vibrations or shocks
- No exposure to direct sunlight, an ambient temperature of 0 to 50°℃ (32 to 122°F) that does not change rapidly
- An ambient non-condensing humidity of 35 to 85 %RH
- No large capacity electromagnetic switches or cables through which large current is flowing
- No water, oil, chemicals or the vapors of these substances can come into direct contact with the unit

#### 3.2 External Dimensions (Scale: mm)

#### 3.3 Mounting

(1) Hook the upper part of the socket on the DIN rail, and mount it (A clicking sound is heard).

(Fig. 3.3-1)

### \land Caution

Before inserting the WIL-102-ECH into the socket, wire the unit. Refer to Section "5. Wiring" (p.12).

(2) Check that the Lock Release has been lowered.

(3) Insert the WIL-102-ECH into the socket.

(4) Fix the WIL-102-ECH and the socket by pushing the Lock Release up.

(Fig. 3.3-4)

### 4. Removal

- (1) Turn the power supply to the unit OFF.
- (2) Pull the Lock Release down, and release the WIL-102-ECH from the socket.

Check that the WIL-102-ECH and the socket are unlocked by pulling the Lock Release down.

(3) Separate the WIL-102-ECH from the socket.

(4) Remove the socket from the DIN rail by pulling the socket Lock Release (at the bottom of the socket) down.

## 5. Wiring

### **Warning**

Turn the power supply to the instrument off before wiring or checking. Working on or touching the terminal with the power switched on may result in severe injury or death due to electrical shock.

### 1 Caution

- Do not leave wire remnants in the instrument, as they could cause a fire or a malfunction.
- Use a solderless terminal with an insulation sleeve in which the M3 screw fits when wiring the unit.
- Tighten the terminal screw using the specified torque. If excessive force is applied to the screw when tightening, the terminal screw may be damaged.
- This instrument does not have a built-in power switch, circuit breaker and fuse. It is necessary to install a power switch, circuit breaker and fuse near the instrument. (Recommended fuse: Time-lag fuse, rated voltage 250 V AC, rated current 2 A)
- For a 24 V AC/DC power source, do not confuse polarity when using direct current (DC).
- Do not apply a commercial power source to the sensor which is connected to the input terminal nor allow the power source to come into contact with the sensor.
- Use the 4-electrode Conductivity Sensor in accordance with the sensor input specifications of this unit.
- Keep the input wires and power lines separate.

#### Note about the 4-Electrode Conductivity Sensor Cable

- The 4-electrode Conductivity Sensor cable is a highly-insulated (electrical) cable. Please handle it with utmost care as follows.
- Do not allow terminals and socket of the 4-electrode Conductivity Sensor cable to come in contact with moisture or oil of any kind. Likewise, ensure fingers are clean, otherwise the insulation will deteriorate, resulting in unstable indication.
- Be sure to keep the cable dry and clean at all times.
- If the cable is stained, clean it with alcohol, and dry it completely.
- For calibration or electrode checking/replacement, the 4-electrode Conductivity Sensor cable should be wired with sufficient length.
- Keep the 4-electrode Conductivity Sensor cable and junction cable away from electrical devices, such as motors or their power lines from which inductive interference emanates.

#### Connection

The 4-electrode Conductivity Sensor cable has the following terminals.

Code	Terminal
1	Conductivity sensor terminal 1
2	Conductivity sensor terminal 2
3	Conductivity sensor terminal 3
4	Conductivity sensor terminal 4
A, B (T, T)	Temperature compensation sensor terminals [Pt100 (2-wire), Pt1000] 5-6
A, B, B	Temperature compensation sensor terminals [Pt100 (3-wire)] 5-6-7
E	Shield wire terminal 8

For the electrode with No Temperature Compensation, A, B (T, T) or A, B, B cables are not available. E cables are available depending on the sensor type.

During operation, the Conductivity/Temperature Display may become abnormal or unstable due to inductive interference or noise. In this case, try [Grounding of shield wire terminal (E) (P.77)].

#### 5.1 Lead Wire Solderless Terminal

Use a solderless terminal with an insulation sleeve in which an M3 screw fits as follows. The tightening torque should be 0.63 N·m.

Solderless Terminal	Manufacturer	Model
Y-type	Nichifu Terminal Industries CO., LTD.	TMEV1.25Y-3S

#### **5.2 Terminal Arrangement**

- 1, 2, 3, 4: Conductivity sensor terminals 1, 2, 3, 4
- Temperature compensation sensor terminals

Temperature element: Pt100 (2-wire type), Pt1000

- A, B, B: Temperature compensation sensor terminals
  - Temperature element: Pt100 (3-wire type)
- Shield wire terminal  $(^{(8)})$ 
  - A1: A1 output terminals (9-10)
  - A2: A2 output terminals (1)-12)
  - A1: A1 output terminals (9-10)

Transmission output 1 terminals (11-12)

Transmission output 2 terminals (9-0)

Transmission output 1 terminals (1-2)

24 V AC/DC (When "1" is added after

RS-485: Serial Communication modular jack

A1, A2, TRANSMIT OUTPUT1, TRANSMIT OUTPUT2 terminals are

#### 5.3 Wire the Communication Line.

Connect to the modular jack at the bottom of the instrument, using CDD (sold separately) or CPP (sold separately).

#### • Wiring Example Using a USB Communication Cable CMC-001-3 (sold separately)

#### Wiring Example Using a Communication Converter IF-400

(Fig. 5.3-2)

#### Shield Wire

Be sure to ground only one end of the shield wire so that current cannot flow to the shield wire. If both ends of the shield wire are grounded, the circuit will be closed, resulting in a ground loop. This may cause noise.

Be sure to ground the FG.

Recommended cable: OTSC-VB 2PX0.5SQ (made by Onamba Co., Ltd.) or equivalent (Use a twisted pair cable.)

#### **Terminator (Terminal Resistor)**

The terminator is mounted at the end of the wire when connecting multiple peripheral devices to a personal computer. The terminator prevents signal reflection and disturbance.

Do not connect a terminator to the communication line because each WIL-102-ECH has built-in pull-up and pull-down resistors.

Communication converter IF-400 (sold separately) has a built-in terminal resistor.

### 6. Outline of Key Operation and Setting Groups

#### 6.1 Outline of Key Operation

Setting items are divided into groups, and group selection has to be made with keypads. Press the 🔘 key in Conductivity/Temperature Display Mode. The unit enters Group Selection mode.

Abbreviations:

Select a group with the  $\square$  key, and press the  $\blacksquare$  key. The unit enters each setting item. To set each item, use the  $\bigtriangleup$  or  $\bigtriangledown$  key, and register the set value with the  $\blacksquare$  key.

#### 6.2 Setting Groups

(\*) Indicates the item selected in [Display selection (p.34)] in Conductivity/Temperature Display Mode.

#### Key Operation

- 🖂 + 🔘 (3 sec): Press and hold the 🖂 key and 😡 key (in that order) together for 3 seconds. The unit will proceed to Conductivity Calibration Zero Adjustment Mode.
- 🖂 + 🚟 (3 sec): Press and hold the 🛆 key and 🗺 key (in that order) together for 3 seconds. The unit enters Transmission Output 1 Zero Adjustment Mode.
- 🖂 + 🚟 (3 sec): Press and hold the 🖂 key and 🚟 key (in that order) together for 3 seconds. The unit enters Transmission Output 2 Zero Adjustment Mode.
- 🔘, 🚟: Press the 🔘 or 🖼 key. The unit will enter the next setting item, illustrated by an arrow.
- First the setting mode appears.
- To revert to Conductivity/Temperature Display Mode, press and hold the 🔘 key for 3 seconds while in any mode.

#### About Setting Items

CELL	Sensor cell constant
	(P.20)
Fro I	Transmission output 1
Ec	type (P.32)

• Upper left: Conductivity Display: Indicates the setting item characters. • Lower left: Temperature Display: Indicates the factory default.

• **Right side**: Indicates the setting item and reference page.

Setting item in shaded section will be displayed only when the corresponding option is ordered.

If the TA option is added, A2 related setting items are not available.

If the TA2 option is added, A1 and A2 related setting items are not available.

(\*1): Factory default value is different depending on the selection in [A representation of the selection in [A representation of the selection of the selectio

(\*2): Factory default value is different depending on the selection in [A represented to be a selection of the selection of t

#### About Key Operation

- $\square$ + $\square$ (3 sec): Press and hold the  $\square$ ,  $\square$  keys (in that order) for 3 sec. The unit enters Temperature calibration mode.
- 🖂 + 🖾 (3 sec): Press and hold the 🖂, 💿 keys (in that order) for 3 sec. The unit enters Conductivity calibration zero adjustment mode.
- 🖂 + 🚟 (3 sec): Press and hold the 🛆, 🖼 keys (in that order) for 3 sec. The unit enters Transmission output 1 zero adjustment mode.
- 🖂 + 🖭 (3 sec): Press and hold the 🖂, 📰 keys (in that order) for 3 sec. The unit enters Transmission output 2 zero adjustment mode.
- To revert to Conductivity/Temperature Display Mode, press and hold the 🔘 key for 3 sec while in any mode.

## 8. Setup

Before using this instrument, setup should be performed to suit the conditions of usage:

Setting the Cell constant correction value, Measurement unit, A11, A12, A21 and A22 types,

Temperature compensation method, Communication,  $A \Box \Box$  output when input errors occur, etc.

Setup can be conducted in the Conductivity Input Group, Temperature Input Group and Basic Function Group.

If the user's specification is the same as the factory default value of the WIL-102-ECH, or if setup has already been completed, it is not necessary to set up the instrument. Proceed to Section "9. Calibration (p.39)".

#### 8.1 Turn the Power Supply ON.

For approximately 4 seconds after the power is switched ON, the input characters are indicated on the Conductivity Display and Temperature Display. See (Table. 8.1-1). (Table. 8.1-1).

(Table: 0.1-1)			
Display	Character	Mea	asurement Unit
	cond	Conductivity (mS/cm,	μ <sub>S/cm</sub> )
		Conductivity (S/m, mS	5/m)
Conductivity Display	5 <i>E R</i>	Seawater salinity (%)	
	58LF	NaCl salinity (%)	
	Г <i>ач</i> ы	TDS conversion (g/L,	mg/L)
Dioplay	Character	Input Temperature	Selection Item in
Display	Character	Specification (*)	[Pt100 Input Wire Type] (p.30)
	PF::::2	Pt100	<i>F'/</i> □ <i>⊑</i> ' : 2-wire type
Temperature Display	PF[]]3	FLIUU	$F' \Gamma \square \exists$ : 3-wire type
	PF 10	Pt1000	

(\*) This input temperature specification was specified when ordering.

During this time, all outputs are in OFF status, and LED indicators except the PWR Indicator turn off. After that, measurement starts, indicating the item selected in [Display selection (p.34)]. This status is called Conductivity/Temperature Display Mode.

#### 8.2 Conductivity Input Group

To enter the Conductivity Input Group, follow the procedure below.

- ① F.n.c. / Press the 🔘 key in Conductivity/Temperature Display Mode.
- 2 c E L Press the Rest key.

The unit enters the Conductivity Input Group, and "Sensor cell constant" is indicated.

## Conductivity Input Error Alarm

Conductivity input error alarm is used for detecting actuator trouble.

Even if Conductivity input error alarm time has elapsed – if conductivity input does not become higher than conductivity input error alarm band – the instrument assumes that actuator trouble has occurred, and sets Status flag 2.

In Serial communication, status can be read by reading Status flag 2 (A1, A2 conductivity input error alarm output flag bit).

Conductivity input error alarm is disabled during Conductivity Zero or Span adjustment.

Conductivity input error alarm is enabled only when  $\mathcal{E}_{c}$ ,  $\mathcal{L}$  (Conductivity input low limit action) or  $\mathcal{E}_{c}$ ,  $\mathcal{H}$  (Conductivity input high limit action) is selected in [A11, A12, A21, A22 type (pp.22, 23)].

## 9. Calibration

Conductivity calibration mode, Temperature calibration mode, and Transmission output 1 and 2 adjustment modes are described below.

## 9.1 Conductivity Calibration Mode

Deterioration of the 4-electrode Conductivity Sensor might cause the cell constant to change. To correct the changed cell constant, conductivity calibration must be performed. Calibrate Conductivity Zero adjustment first, followed by Conductivity Span adjustment. During conductivity calibration, A

However, if  $L \Box c \neq l$  (Lock 1),  $L \Box c c \neq l$  (Lock 2) or  $L \Box c \neq l$  (Lock 3) is selected in [Set value lock (p.31)], the unit cannot move to Conductivity calibration mode.

The following outlines the procedure for conductivity calibration.

- When selecting bEFH (Last value HOLD) in [Transmission output 1 status when calibrating (p.33)] or [Transmission output 2 status when calibrating (p.33)], select it while the 4-electrode Conductivity Sensor is being immersed in the solution currently measured.
- 2 Do not immerse the 4-electrode Conductivity Sensor in the standard solution.
- <sup>③</sup> Press and hold the 🖂 key and 💿 key (in that order) together for 3 seconds in Conductivity/ Temperature Display Mode.

The unit enters Conductivity calibration Zero adjustment mode, and indicates the following.

Display	Indication
Conductivity Display	$B a \Box a$ and conductivity are indicated alternately.
Temperature Display	Conductivity Zero adjustment value

④ Set the Conductivity Zero adjustment value with the △ or ▽ key so that the conductivity becomes 0. If conductivity is 0, this adjustment is not necessary.

Setting range of the Conductivity Zero adjustment value differs depending on the measurement range. See (Table 9.1-1.). (p. 40)

However, it is effective within the measurement range regardless of the Conductivity Zero adjustment value.

### (Table 9.1-1)

Meas	surement Range	Conductivity Zero Adjustment Value Setting Range	
	0.00 to 20.00 mS/cm	-2.00 to 2.00 mS/cm	
	0.0 to 200.0 mS/cm	-20.0 to 20.0 mS/cm	
	0.0 to 500.0 mS/cm	-50.0 to 50.0 mS/cm	
	0 to 500 mS/cm	-50 to 50 mS/cm	
	0.000 to 2.000 mS/cm	-0.200 to 0.200 mS/cm	
	0.000 to 5.000 mS/cm	-0.500 to 0.500 mS/cm	
	0.00 to 50.00 mS/cm	-5.00 to 5.00 mS/cm	
	0 to 2000 $\mu$ S/cm	-200 to 200 µS/cm	
	0 to 5000 $\mu m S/cm$	-500 to 500 µS/cm	
Call	0.000 to 2.000 S/m	-0.200 to 0.200 S/m	
Cell constant	0.00 to 20.00 S/m	-2.00 to 2.00 S/m	
1.0/cm	0.00 to 50.00 S/m	-5.00 to 5.00 S/m	
1.0/011	0.0 to 50.0 S/m	-5.0 to 5.0 S/m	
	0 to 2000 mS/m	-200 to 200 mS/m	
	0.000 to 5.000 S/m	-0.500 to 0.500 S/m	
	0.0 to 200.0 mS/m	-20.0 to 20.0 mS/m	
	0.0 to 500.0 mS/m	-50.0 to 50.0 mS/m	
	0.0 to 20.0 g/L	-2.0 to 2.0 g/L	
	0 to 200 g/L	-20 to 20 g/L	
	0 to 500 g/L	-50 to 50 g/L	
	0 to 2000 mg/L	-200 to 200 mg/L	
	0 to 5000 mg/L	-500 to 500 mg/L	
	0.0 to 200.0 mS/cm	-20.0 to 20.0 mS/cm	
	0.0 to 500.0 mS/cm	-50.0 to 50.0 mS/cm	
	0 to 2000 mS/cm	-200 to 200 mS/cm	
Cell	0.00 to 20.00 S/m	-2.00 to 2.00 S/m	
constant	0.00 to 50.00 S/m	-5.00 to 5.00 S/m	
10.0/cm	0.0 to 200.0 S/m	-20.0 to 20.0 S/m	
0 to 200 g/L		-20 to 20 g/L	
	0 to 500 g/L	-50 to 50 g/L	
	0 to 2000 g/L	-200 to 200 g/L	
Seawater sali	nity 0.00 to 4.00%	-0.40 to 0.40%	
NaCl salinity (	0.00 to 20.00%	-2.00 to 2.00%	

<sup>⑤</sup> Press the <sup>™</sup> key.

Conductivity Zero adjustment value will be registered, and the unit will move to Conductivity calibration Span adjustment mode.

The following is indicated in Conductivity calibration Span adjustment mode.

Display	Indication
Conductivity Display	Ball'h and conductivity are indicated alternately.
Temperature Display	Conductivity Span adjustment value

<sup>6</sup> Immerse the 4-electrode Conductivity Sensor in the standard solution.

 Set the Conductivity Span adjustment value with the or key, checking the conductivity. Conductivity multiplied by the Span adjustment value is displayed.
 Conductivity Span adjustment value: 0.700 to 1.300

<sup>(8)</sup> Press the **E** key.

Conductivity Span adjustment value will be registered, and the unit will revert to Conductivity/ Temperature Display Mode.

#### 9.2 Temperature Calibration Mode

To calibrate a temperature, set a temperature calibration value.

If aFF (No temperature compensation) is selected in [Temperature compensation method (p.30)], Temperature calibration mode is not available.

The unit cannot enter Temperature calibration mode in the following cases: • When  $\angle \Box \Box = i$  (Lock 1),  $\angle \Box \Box \Xi^{2}$  (Lock 2) or  $\angle \Box \Box \Xi^{2}$  (Lock 3) is selected in [Set value lock (p.31)].

When a sensor cannot be set at the exact location where measurement is desired, the resulting measured temperature may deviate from the temperature in the desired location. In this case, the desired temperature can be set for the desired location by setting a temperature calibration value. However, it is effective within the input rated range regardless of the temperature calibration value. Temperature after calibration = Current temperature + (Temperature calibration value) (e.g.) When current temperature is  $23.5^{\circ}$ C,

If temperature calibration value is set to  $1.5^{\circ}$ C:  $23.5 + (1.5) = 25.0^{\circ}$ C If temperature calibration value is set to  $-1.5^{\circ}$ C:  $23.5 + (-1.5) = 22.0^{\circ}$ C

The following outlines the procedure for temperature calibration.

(1) Press and hold the 🛆 key and 🔘 key (in that order) together for 3 seconds in Conductivity/ Temperature Display Mode.

The unit proceeds to Temperature calibration mode, and indicates the following.

Display	Indication
Conductivity Display	לם and temperature are indicated alternately.
Temperature Display	Temperature calibration value

② Set a temperature calibration value with the △ or ▽ key, checking temperature. Setting range: -10.0 to 10.0°C

## ③ Press the 📰 key.

Temperature calibration is complete, and the unit reverts to Conductivity/Temperature Display Mode.

### 9.3 Transmission Output 1 Adjustment Mode

Fine adjustment of Transmission output 1 is performed.

WIL-102-ECH is adjusted at the factory, however, differences may occur between the indication value of the connected equipment (recorders, etc.) and output value of this instrument. In this case, perform Transmission output 1 Zero and Span adjustments. Transmission output 1 adjustment mode is available when Transmission output 1 (TA option) or

Transmission output 2 (TA2 option) is ordered.

The unit cannot enter Transmission output 1 Zero adjustment mode in the following cases:

- During Conductivity Zero or Span adjustment, or temperature calibration
- When  $L \Box c \downarrow$  (Lock 1),  $L \Box c c \downarrow$  (Lock 2) or  $L \Box c J$  (Lock 3) is selected in [Set value lock (p.31)]

The following outlines the procedure for Transmission output 1 adjustment.

 Press and hold the △ key and <sup>™</sup> key (in that order) together for 3 seconds in Conductivity/Temperature Display Mode.

The unit enters Transmission output 1 Zero adjustment mode, and indicates the following.

Display	Indication
Conductivity Display	RJE I
Temperature Display	Transmission output 1 Zero adjustment value

② Set a Transmission output 1 Zero adjustment value with the △ or ▽ key, while viewing the value indicated on the connected equipment (recorders, etc.). Setting range: ±5.00% of Transmission output 1 span

## 3 Press the **E** key.

The unit enters Transmission output 1 Span adjustment mode, and indicates the following.

Display	Indication
Conductivity Display	RJ5 /
Temperature Display	Transmission output 1 Span adjustment value

- ④ Set a Transmission output 1 Span adjustment value with the △ or ▽ key, while viewing the value indicated on the connected equipment (recorders, etc.).
   Setting range: ±5.00% of Transmission output 1 span
- $^{(5)}$  Press the  $\square$  key.

The unit reverts to Transmission output 1 Zero adjustment mode. Repeat steps 2 to 5 if necessary.

<sup>(6)</sup> To finish Transmission output 1 adjustment, press the <sup>(E)</sup>/<sub>E=</sub> key in Transmission output 1 Span adjustment mode.

The unit reverts to Conductivity/Temperature Display Mode.

### 9.4 Transmission Output 2 Adjustment Mode

Fine adjustment of Transmission output 2 is performed.

WIL-102-ECH is adjusted at the factory, however, differences may occur between the indication value of the connected equipment (recorders, etc.) and output value of this instrument.

In this case, perform Transmission output 2 Zero and Span adjustments.

Transmission output 2 adjustment mode is available only when Transmission output 2 (TA2 option) is ordered.

The unit cannot enter Transmission output 2 Zero adjustment mode in the following cases:

- During Conductivity Zero or Span adjustment, or temperature calibration
- When  $L \Box c i$  (Lock 1),  $L \Box c c i$  (Lock 2) or  $L \Box c i j$  (Lock 3) is selected in [Set value lock (p.31)]

The following outlines the procedure for Transmission output 2 adjustment.

The unit enters Transmission output 2 Zero adjustment mode, and indicates the following.

Display	Indication
Conductivity Display	RJEZ
Temperature Display	Transmission output 2 Zero adjustment value

② Set a Transmission output 2 Zero adjustment value with the or key, while viewing the value indicated on the connected equipment (recorders, etc.). Setting range: ±5.00% of Transmission output 2 span

## 3 Press the **E** key.

The unit enters Transmission output 2 Span adjustment mode, and indicates the following.

Display Indication	
Conductivity Display	8342
Temperature Display	Transmission output 2 Span adjustment value

- ④ Set a Transmission output 2 Span adjustment value with the △ or ▽ key, while viewing the value indicated on the connected equipment (recorders, etc.).
   Setting range: ±5.00% of Transmission output 2 span
- $^{(5)}$  Press the  $\square$  key.

The unit reverts to Transmission output 2 Zero adjustment mode. Repeat steps (2) to (5) if necessary.

<sup>(6)</sup> To finish Transmission output 2 adjustment, press the <sup>(K)</sup> key in Transmission output 2 Span adjustment mode.

The unit reverts to Conductivity/Temperature Display Mode.

## 10. Measurement

## **10.1 Starting Measurement**

After mounting to the control panel, wiring, setup and calibration are complete, turn the power to the instrument ON.

For approximately 4 seconds after the power is switched ON, the input characters are indicated on the Conductivity Display and Temperature Display. See (Table 10.1-1).

Display	Character	Me	asurement Unit			
Conductivity Display	cont		Conductivity (mS/cm, $\mu$ S/cm)			
	51	Conductivity (S/m, m	,			
	'5 <i>E R</i>	Seawater salinity (%)				
	58LF	NaCl salinity (%)				
	Г <i>ач</i> ы	TDS conversion (g/L, mg/L)				
Display	Character	Input Temperature Specification (*)	Selection Item in [Pt100 Input Wire Type] (p.30)			
Temperature Display	PF 2	D#4.00	<i>F'I</i> : 2-wire type			
	PF[]]3	- Pt100	<i>₽Г</i> ⊡∃: 3-wire type			
	PF 10	Pt1000				

(\*) This input temperature specification was specified at the time of ordering.

During this time, all outputs are in OFF status, and the LED indicators except PWR Indicator are unlit. Measurement will then start, indicating the item selected in [Display selection (p.34)].

## 10.2 A Output

When  $\mathcal{E}_{\mathcal{A}}\mathcal{L}$  (Conductivity input low limit action),  $\mathcal{E}_{\mathcal{A}}\mathcal{H}$  (Conductivity input high limit action),  $\mathcal{E}_{\mathcal{A}}\mathcal{H}\mathcal{L}$  (Temperature input low limit action), or  $\mathcal{E}_{\mathcal{A}}\mathcal{H}\mathcal{H}$  (Temperature input high limit action) is selected in [A11, A12, A21, A22 type (pp. 22, 23)], the A output is turned ON if the measured value exceeds or drops below the A value.

When  $\mathcal{E}_{\mathcal{C}}\mathcal{H}\mathcal{L}$  (Conductivity input High/Low limits independent action),  $\mathcal{E}_{\mathcal{O}}\mathcal{H}\mathcal{L}$  (Temperature input High/Low limits independent action) is selected in [A11, A12, A21, A22 type (pp. 22, 23)], the A output is turned ON if the measured value exceeds the A High/Low limits independent action upper side span, or drops below the lower side span.

A1 or A2 output is turned ON depending on the selection in [A1/A2 output allocation (p.35)] and in [Output ON time/OFF time when A1/A2 output is ON (pp. 35, 36)].

If Output ON time and OFF time are set, A1 or A2 output can be turned ON/OFF in a configured cycle when A1 or A2 output is ON. (Fig. 10.2-1)

A output status can be read by reading Status flag 1 (A11, A12, A21, A22 output flag bit) in Serial communication.

A output status, when input errors occur, differs depending on the selection in [A output when input errors occur (p.29)].

- If  $\square F F \square$  (Disabled) is selected, A  $\square$  output and A  $\square$  output status will be turned OFF when input errors occur.
- If *are* (Enabled) is selected, A output and A output status will be maintained when input errors occur.

### 10.3 Conductivity Input Error Alarm

Conductivity input error alarm is used for detecting actuator trouble.

Even if conductivity input error alarm time (pp. 37, 38) has elapsed, and if conductivity input does not become higher than conductivity input error alarm band (pp. 37, 38), the unit assumes that actuator trouble has occurred, and writes Status flag 2.

In Serial communication, status can be read by reading Status flag 2 (A1, A2 conductivity input error alarm output flag bit).

Conductivity input error alarm is disabled during Conductivity Zero or Span adjustment.

Conductivity input error alarm is enabled only when  $\mathcal{E}_{\mathcal{L}}\mathcal{L}$  (Conductivity input low limit action) or  $\mathcal{E}_{\mathcal{L}}\mathcal{H}$  (Conductivity input high limit action) is selected in [A11, A12, A21, A22 type (pp.22, 23)].

### 10.4 Error Output

If  $\mathcal{E} \subset \mathcal{A}^{\mathcal{F}}$  (Error output) is selected in [A11, A12, A21, A22 type (pp. 22, 23)], the A1 or A2 output will be turned ON when error type is "Error". See (Table 10.6-1).

### 10.5 Fail Output

If  $FRL \subseteq$  (Fail output) is selected in [A11, A12, A21, A22 type (pp. 22, 23)], the A1 or A2 output will be turned ON when error type is "Fail". See (Table 10.6-1).

#### 10.6 Error Code during Measurement

For Temperature sensor error or outside temperature compensation range during measurement, their corresponding error codes flash on the Temperature Display as shown below in (Table 10.6-1).

(10010 101					
Error Code	Error Type	Error Contents	Description	Occurrence	
E-01	Fail	Temperature sensor burnout	Temperature sensor lead wire is burnt out.		
E-02	Fail	Temperature sensor short-circuited	Temperature sensor lead wire is short-circuited.	When measuring	
E-03	Error	Outside temperature compensation range	Measured temperature has exceeded 110.0℃.	or calibrating	
E-04	Error	Outside temperature compensation range	Measured temperature is less than 0.0℃.		

### (Table 10.6-1)

#### 10.7 Transmission Output 1 and 2

Converting conductivity or temperature to analog signal every input sampling period, outputs in current. (Factory default: Transmission output 1: Conductivity, Transmission output 2: Temperature)

If  $\Box \not \vdash \not \vdash \Box$  (No temperature compensation) is selected in [Temperature compensation method (p.30)], and if  $\not \vdash \overleftarrow{\Box} \not \vdash \overleftarrow{\Box} \not \vdash$  (Temperature transmission) is selected in [Transmission output 1 or 2 type (p.32)], Transmission output 1 or 2 value differs depending on the selection in [Temperature Display when no temperature compensation (p.34)].

- If ロケチロ (Unlit) or 'っ ロロ (Reference temperature) is selected, the value set in [Reference temperature (p.30)] will be output.
- If PB (Measured value) is selected, the measured value will be output.

If Transmission output 1 high limit and low limit are set to the same value, Transmission output 1 will be fixed at 4 mA DC.

If Transmission output 2 high limit and low limit are set to the same value, Transmission output 2 will be fixed at 4 mA DC.

Resolution	12000
Current	4 to 20 mA DC (Load resistance: Max 550 $\Omega$ )
Output accuracy	Within $\pm 0.3\%$ of Transmission output 1 or 2 span

## **11.** Communication

## 11.1 System Configuration Example

## When Using USB Communication Cable CMC-001-3 (sold separately)

(Fig. 11.1-1)

#### When Using Communication Converter IF-400 (sold separately)

(Fig. 11.1-2)

## 11.2 Setting Method of the Conductivity Meter

Communication parameters can be set in the Basic Function Group. To enter the Basic Function Group, follow the procedure below.

- ① a.f.E.r Press the 🔘 key 3 times in Conductivity/Temperature Display Mode.
- $2 c \bar{n} c L$  Press the Est key twice. "Communication protocol" will appear.
- ③ Set each item. (Use the  $\bigtriangleup$  or  $\bigtriangledown$  key for settings, and register the selection/value with the

Character	Setting Item, Function, Setting Range	Factory Default
cā41	Communication protocol	Shinko protocol
noñL	Selects communication protocol.

Press the set with the set of t

### **11.3 Communication Procedure**

Communication starts with command transmission from the host computer (hereafter Master) and ends with the response of the WIL-102-ECH (hereafter Slave).

#### Response with Data

When the master sends the reading command, the slave responds with the corresponding set value or current status.

#### Acknowledgement

When the master sends the setting command, the slave responds by sending acknowledgement after the processing is terminated.

#### Negative Acknowledgement

When the master sends a non-existent command or value out of the setting range, the slave returns a negative acknowledgement.

#### No Response

The slave will not respond to the master in the following cases:

- Global address (Shinko protocol) is set.
- Broadcast address (MODBUS protocol) is set.
- Communication error (framing error, parity error)
- Checksum error (Shinko protocol), LRC discrepancy (MODBUS ASCII mode), CRC-16 discrepancy (MODBUS RTU mode)

#### Communication Timing of the RS-485

#### Master Side (Take note while programming)

When the master starts transmission through the RS-485 communication line, the master is arranged so as to provide an idle status (mark status) transmission period of 1 or more characters before sending the command to ensure synchronization on the receiving side.

Set the program so that the master can disconnect the transmitter from the communication line within a 1-character transmission period after sending the command in preparation for reception of the response from the slave.

To avoid collision of transmissions between the master and the slave, send the next command after carefully checking that the master has received the response.

If a response to the command is not returned due to communication errors, set the Retry Processing to send the command again. (It is recommended to execute Retry twice or more.)

#### Slave Side

When the slave starts transmission through the RS-485 communication line, the slave is arranged so as to provide an idle status (mark status) transmission period of 1 or more characters before sending the response to ensure synchronization on the receiving side.

The slave is arranged so as to disconnect the transmitter from the communication line within a 1-character transmission period after sending the response.

#### 11.4 Shinko Protocol

#### 11.4.1 Transmission Mode

Shinko protocol is composed of ASCII. Hexadecimal (0 to 9, A to F), which is divided into high order (4-bit) and low order (4-bit) out of 8-bit binary data in command is transmitted as ASCII characters. Data format Start bit: 1 bit

Start bit: 1 bit Data bit: 7 bits Parity: Even Stop bit: 1 bit

Error detection: Checksum

#### 11.4.2 Command Configuration

All commands are composed of ASCII.

The data (set value, decimal number) is represented by hexadecimal numbers.

The negative numbers are represented in 2's complement.

Numerals written below the command represent number of characters.

#### (1) Setting Command

Header (02H)	Address	Sub address (20H)	Command type (50H)	Data item	Data	Checksum	Delimiter (03H)
1	1	1	1	4	4	2	1
(Fig. 11.4.2-1)							

#### (2) Reading Command

Header (02H)	Address	Sub address (20H)	Command type (20H)	Data item	Checksum	Delimiter (03H)
1	1	1	1	4	2	1
	/	44400				

(Fig. 11.4.2-2)

#### (3) Response with Data

	Header (06H)	Address	Sub address (20H)	Command type (20H)	Data item	Data	Checksum	Delimiter (03H)
	1	1	1	1	4	4	2	1
(Fig. 11.4.2-3)								

#### (4) Acknowledgement

Header (06H)	Address	Checksum	Delimiter (03H)		
1	1	2	1		
	(Fig. 11.4.2-4)				

#### (5) Negative Acknowledgement

Header	Address	Error	Checksum	Delimiter
(15H)	Audress	code	Checksum	(03H)
1	1	1	2	1
	/ <b>-</b> ·			

Header:

(Fig. 11.4.2-5) Control code to represent the beginning of the command or the response.

ASCII codes are used.

Setting command, Reading command: STX (02H) fixed

Response with data, Acknowledgement: ACK (06H) fixed

Negative acknowledgement: NAK (15H) fixed

Instrument Number (Address): Numbers by which the master discerns each slave.

Instrument numbers 0 to 94 and Global address 95.

ASCII codes (20H to 7FH) are used by adding 20H to instrument numbers 0 to 95 (00H to 5FH).

95 (7FH) is called Global address, which is used when the same command is sent to all the slaves connected. However, the response is not returned.

#### Sub Address: 20H fixed

Command Type: Code to discern Setting command (50H) and Reading command (20H).

Data Item:	Classification of the command object. Composed of 4-digit hexadecimal numbers, using ASCII. (Refer to "11.6. Communication Command Table".) (pp.55 to 63)
Data:	The contents of data (set value) differ depending on the setting command. Composed of 4-digit hexadecimal numbers, using ASCII. (Refer to "11.6. Communication Command Table".) (pp.55 to 63)
Checksum:	2-character data to detect communication errors. (Refer to "11.4.3 Checksum Calculation".) (p.50)
Delimiter:	Control code to represent the end of command. ASCII code ETX (03H) fixed
Error Code:	<ul> <li>Represents an error type, using ASCII.</li> <li>1 (31H)Non-existent command</li> <li>2 (32H)Not used</li> <li>3 (33H)Setting outside the setting range</li> <li>4 (34H)Status unable to be set (e.g. During calibration mode)</li> <li>5 (35H)During setting mode by keypad operation</li> </ul>

#### 11.4.3 Checksum Calculation

Checksum is used to detect receiving errors in the command or data. Set the program for the master side as well to calculate the checksum of the response data from the slaves so that communication errors can be checked.

The ASCII code (hexadecimal) corresponding to the characters which range from the address to that before the checksum is converted to binary notation, and the total value is calculated. The lower one byte of the total value is converted to 2's complement, and then to hexadecimal numbers, that is, ASCII code for the checksum.

• 1's complement: Reverse each binary bit. 0 will become 1 and vice versa.

• 2's complement: Add 1 to 1's complement.

#### **Checksum Calculation Example**

A11 value: 1.00 (0064H)

Address (instrument number): 0 (20H)

(Fig. 11.4.3-1)

#### 11.5 MODBUS Protocol

#### 11.5.1 Transmission Mode

There are 2 transmission modes (ASCII and RTU) in MODBUS protocol.

#### ASCII Mode

Hexadecimal (0 to 9, A to F), which is divided into high order (4-bit) and low order (4-bit) out of 8-bit binary data in command is transmitted as ASCII characters.

Data format Start bit: 1 bit Data bit: 7 bits (8 bits) (Selectable) Parity: Even (No parity, Odd) (Selectable) Stop bit: 1 bit (2 bits) (Selectable)

Error detection : LRC (Longitudinal Redundancy Check)

#### **RTU Mode**

8-bit binary data in command is transmitted as it is.

Data format Start bit: 1 bit

Data bit: 8 bits

Parity: No parity (Even, Odd) (Selectable) Stop bit: 1 bit (2 bits) (Selectable)

Error detection: CRC-16 (Cyclic Redundancy Check)

#### 11.5.2 Data Communication Interval

#### ASCII Mode

Max.1 second of interval between ASCII mode characters

#### **RTU Mode**

Communication speed 9600 bps, 19200 bps:

To transmit continuously, an interval between characters which consist of one message, must be within 1.5-character transmission times.

Communication speed 38400 bps:

To transmit continuously, an interval between characters which consist of one message, must be within 750  $\mu$ s.

If an interval lasts longer than 1.5-character transmission times or 750  $\mu$ s, the WIL-102-ECH assumes that transmission from the master is finished, which results in a communication error, and will not return a response.

#### 11.5.3 Message Configuration

#### ASCII Mode

ASCII mode message is configured to start by Header [: (colon)(3AH)] and end by Delimiter [CR (carriage return) (0DH) + LF (Line feed)(0AH)].

Header	Slave	Function	Data	Error Check	Delimiter	Delimiter
(:)	Address	Code	Dala	LRC	(CR)	(LF)

#### **RTU Mode**

Communication speed 9600 bps, 19200 bps: RTU mode is configured to start after idle time is processed for more than 3.5-character transmissions, and end after idle time is processed for more than 3.5-character transmissions.

Communication speed 38400 bps: RTU mode is configured to start after idle time is processed for more than 1.75 ms, and end after idle time is processed for more than 1.75 ms.

3.5 Idle	Slave	Function	Dete	Error Check	3.5 Idle
Characters	Address	Code	Data	CRC-16	Characters

#### (1) Slave Address

Slave address is an individual instrument number on the slave side, and is set within the range 0 to 95 (00H to 5FH).

The master identifies slaves by the slave address of the requested message.

The slave informs the master which slave is responding to the master by placing its own address in the response message.

Slave address 00H (Broadcast address) can identify all the slaves connected. However, slaves do not respond.

#### (2) Function Code

The function code is the command code for the slave to undertake the following action types. **(Table 11.5.3-1)** 

Function Code	Contents
03 (03H)	Reading the set value and information from slaves
06 (06H)	Setting to slaves

Function code is used to discern whether the response is normal (acknowledgement) or if any error (negative acknowledgement) has occurred when the slave returns the response message to the master. When acknowledgement is returned, the slave simply returns the original function code.

When negative acknowledgement is returned, the MSB of the original function code is set as 1 for the response.

(For example, when the master sends request message setting 10H to the function code by mistake, slave returns 90H by setting the MSB to 1, because the former is an illegal function.)

For negative acknowledgement, the exception codes below (Table 11.5.3-2) are set to the data of the response message, and returned to the master in order to inform it of what kind of error has occurred.

#### (Table 11.5.3-2)

Exception Code	Contents
1 (01H)	Illegal function (Non-existent function)
2 (02H)	Illegal data address (Non-existent data address)
3 (03H)	Illegal data value (Value out of the setting range)
17 (11H)	Shinko protocol error code 4 [Status unable to be set (e.g.) During calibration mode]
18 (12H)	Shinko protocol error code 5 (During setting mode by keypad operation)

#### (3) Data

Data differs depending on the function code.

A request message from the master is composed of data item, amount of data and setting data. A response message from the slave is composed of the byte count, data and exception codes in negative acknowledgements, corresponding to the request message. Effective range of data is -32768 to 32767 (8000H to 7FFFH).

#### (4) Error Check

#### ASCII Mode

After calculating LRC (Longitudinal Redundancy Check) from the slave address to the end of data, the calculated 8-bit data is converted to two ASCII characters, and are appended to the end of message.

#### How to Calculate LRC

- ① Create a message in RTU mode.
- 2 Add all the values from the slave address to the end of data. This is assumed as X.
- <sup>③</sup> Make a complement for X (bit reverse). This is assumed as X.
- 4 Add a value of 1 to X. This is assumed as X.
- <sup>⑤</sup> Set X as an LRC to the end of the message.
- <sup>6</sup> Convert the whole message to ASCII characters.

#### **RTU Mode**

After calculating CRC-16 (Cyclic Redundancy Check) from the slave address to the end of the data, the calculated 16-bit data is appended to the end of message in sequence from low order to high order.

### How to calculate CRC-16

In the CRC-16 system, the information is divided by the polynomial series. The remainder is added to the end of the information and transmitted. The generation of a polynomial series is as follows. (Generation of polynomial series:  $X^{16} + X^{15} + X^2 + 1$ )

- $\overset{\frown}{1}$  Initialize the CRC-16 data (assumed as X) (FFFFH).
- <sup>2</sup> Calculate exclusive OR (XOR) with the 1st data and X. This is assumed as X.
- ③ Shift X one bit to the right. This is assumed as X.
- <sup>(4)</sup> When a carry is generated as a result of the shift, XOR is calculated by X of <sup>(3)</sup> and the fixed value (A001H). This is assumed as X. If a carry is not generated, go to step <sup>(5)</sup>.
- (5) Repeat steps (3) and (4) until shifting 8 times.
- $^{\textcircled{6}}$  XOR is calculated with the next data and X. This is assumed as X.
- O Repeat steps 3 to 5.
- (8) Repeat steps (3) to (5) up to the final data.
- <sup>(9)</sup> Set X as CRC-16 to the end of message in sequence from low order to high order.

### 11.5.4 Message Example

### ASCII Mode

Numerals written below the command represent the number of characters.

### ① Reading [Slave address 1, Data item 0080H (Conductivity)]

• A request message from the master

Amount of data means how many data items are to be read. It is fixed as (30H 30H 30H 31H).

Header	Slave	Function	Data Item Amount of Data		Error Check	Delimiter
	Address	Code	[0080H]	[0001H]	LRC	
(3AH)	(30H 31H)	(30H 33H)	(30H 30H 38H 30H)	(30H 30H 30H 31H)	(37H 42H)	(0DH 0AH)
1	2	2	4	4	2	2

• Response message from the slave in normal status [1.00 mS/cm (0064H)]

The response byte count means the byte count of the data which has been read.

It is	fixed	asi	(30H	32H)	)
1110	IIAGU	u0 (			

	1	/				
Header	Slave	Function	Response Byte Count	Data	Error Check	Delimiter
	Address	Code	[02H]	[0064H]	LRC	
(3AH)	(30H 31H)	(30H 33H)	(30H 32H)	(30H 30H 36H 34H)	(39H 36H)	(0DH 0AH)
1	2	2	2	4	2	2

• Response message from the slave in exception (error) status (When a data item is incorrect) The function code MSB is set to 1 for the response message in exception (error) status (83H). The exception code 02H (Non-existent data address) is returned (error)

Header Slave		Function	Exception Code	Error Check	Delimiter				
	Address	Code	[02H]	LRC					
(3AH)	(30H 31H)	(38H 33H)	(30H 32H)	(37H 41H)	(0DH 0AH)				
1	2	2	2	2	2				

#### <sup>(2)</sup> Setting [Slave address 1, Data item 0006H (A11 value)]

• A request message from the master [When A11 value is set to 1.00 (0064H)]

	<u> </u>				/-	
Header	Slave	Function	Data Item	Data	Error Check	Delimiter
	Address	Code	[0006H]	[0006H] [0064H]		
(3AH)	(30H 31H)	(30H 36H)	(30H 30H 30H 36H)	(30H 30H 36H 34H)	(38H 44H)	(0DH 0AH)
1	2	2	4	4	2	2

#### • Response message from the slave in normal status

1 toop on o								
Header	Slave	Function	Data Item	Data	Error Check	Delimiter

1	2	2	2	2	2					

#### **RTU Mode**

Numerals written below the command represent the number of characters.

### ① Reading [Slave address 1, Data item 0080H (Conductivity)]

• A request message from the master

Amount of data means how many data items are to be read. It is fixed as (0001H).

3.5 Idle Characters	Slave Address (01H)	Function Code (03H)	Data Item (0080H)	Amount of Data (0001H)	Error Check CRC-16 (85E2H)	3.5 Idle Characters
	1	1	2	2	2	

• Response message from the slave in normal status [1.00 mS/cm (0064H)]

The response byte count means the byte count of the data which has been read. It is fixed as (02H).

3.5 Idle Characters	Slave Address (01H)	Function Code (03H)	Response Byte Count (02H)	Data (0064H)	Error Check CRC-16 (B9AFH)	3.5 Idle Characters
	1	1	1	2	2	

• Response message from the slave in exception (error) status (When data item is incorrect). The function code MSB is set to 1 for the response message in exception (error) status (83H). The exception code (02H: Non-existent data address) is returned (error).

3.5 Idle Characters	Slave Address (01H)	Function Code (83H)	Exception Code (02H)	Error Check CRC-16 (C0F1H)	3.5 Idle Characters	
	1	1	1	2		-

#### ② Setting [Slave address 1, Data item 0006H (A11 value)]

• A request message from the master [When A11 value is set to 1.00 (0064H)]

3.5 Idle Characters	Slave Address (01H)	Function Code (06H)	Data Item (0006H)	Data (0064H)	Error Check CRC-16 (6820H)	3.5 Idle Characters	
	1	1	2	2	2		

#### • Response message from the slave in normal status

3.5 Idle Characters	Slave Address (01H)	Function Code (06H)	Data Item (0006H)	Data (0064H)	Error Check CRC-16 (6820H)	3.5 Idle Characters
	1	1	2	2	2	

• Response message from the slave in exception (error) status (When a value out of the setting range is set)

The function code MSB is set to 1 for the response message in exception (error) status (86H). The exception code (03H: Value out of the setting range) is returned (error).

3.5 Idle Characters	Slave Address (01H)	Function Code (86H)	Exception Code (03H)	Error Check CRC-16 (0261H)	3.5 Idle Characters	
	1	1	1	2		

### **11.6 Communication Command Table**

#### 11.6.1 Notes about Setting/Reading Command

- The data (set value, decimal) is converted to hexadecimal numbers. A negative number is represented in 2's complement.
- When connecting multiple slaves, the address (instrument number) must not be duplicated.
- Data item 0200H to 0209H (User save area 1 to 10) can be read or set in 1 word units.
- Effective range of data is -32768 to 32767 (8000H to 7FFFH).
- MODBUS protocol uses Holding Register addresses. The Holding Register addresses are created as follows. A Shinko command data item is converted to decimal number, and the offset of 40001 is added. The result is the Holding Register address.

Using Data item 0001H (Sensor cell constant) as an example:

- Data item in the sending message is 0001H, however, MODBUS protocol Holding Register address is 40002 (1 + 40001).
- Even if options are not ordered, setting or reading via software communication will be possible. Command contents of the A11, A12, A21, A22 will function, however, Transmission output 1 and 2 command contents will not function.

### (1) Setting Command

- Up to 1,000,000 (one million) entries can be stored in non-volatile IC memory. If the number of settings exceeds the limit, the data will not be saved. So, ensure the set values are not frequently changed via software communication. (If a value set via software communication is the same as the value before the setting, the value will not be written in non-volatile IC memory.)
- Be sure to select Lock 3 when changing the set value frequently via software communication. If Lock 3 is selected, all set values – except Sensor cell constant, Measurement unit, Measurement range, Conductivity Zero and Span adjustment values, Temperature calibration value, Transmission output 1 Zero and Span adjustment values, Transmission output 2 Zero and Span adjustment values – can be temporarily changed. However, they revert to their previous value after the power is turned off because they are not saved in the non-volatile IC memory. Do not change setting items (A11, A12, A21 and A22 types). If they are changed, they will affect other setting items.
- Setting range of each item is the same as that of keypad operation.
- When the data (set value) has a decimal point, a whole number (hexadecimal) without a decimal point is used.
- If A11, A12, A21 or A22 type is changed at Data item 0005H (A11 type), 0050H (A12 type), 0051H (A21 type) or 052H (A22 type), the A11, A12, A21 or A22 value will default to 0.00 or 0.0. The output status of A11, A12, A21 or A22 will also be initialized.
- Settings via software communication are possible while in Set value lock status.
- Communication parameters such as Instrument Number, Communication Speed of the slave cannot be set by software communication. They can only be set via the keypad. (p.47)
- When sending a command by Global address [95 (7FH), Shinko protocol] or Broadcast address [00H, MODBUS protocol], the same command is sent to all the slaves connected. However, the response is not returned.

#### (2) Reading Command

• When the data (set value) has a decimal point, a whole number (hexadecimal) without a decimal point is used for a response.

## 11.6.2 Setting/Reading Command

Shinko Command Type	MODBUS	Data Item		Data	
50H/20H	06H/03H	0001H	Sensor cell constant	0000H: 1.0/cm 0001H: 10.0/cm	
50H/20H	06H/03H	0002H	Cell constant correction value	Set value	
50H/20H	06H/03H	0003H	Measurement unit	0000H: Conductivity (mS/cm, µS/cm) 0001H: Conductivity (S/m, mS/m) 0002H: Seawater salinity (%) 0003H: NaCl salinity (%) 0004H: TDS conversion (g/L, mg/L)	
50H/20H	06H/03H	0004H	Measurement range	When 1.0/cm is selected in [Sensor cell constant], and Conductivity           (mS/cm, μS/cm) in [Measurement unit]:           000H:         0.00 to 20.00 mS/cm           0001H:         0.00 to 200.0 mS/cm           0002H:         0.0 to 500.0 mS/cm           0003H:         0 to 5000 mS/cm           0004H:         0.000 to 5.000 mS/cm           0005H:         0.000 to 5.000 mS/cm           0005H:         0.000 to 50.00 mS/cm           0006H:         0.00 to 50.00 mS/cm           0007H:         0 to 2000 μS/cm           0008H:         0 to 5000 μS/cm           0008H:         0 to 5000 mS/cm           00011:         0.000 to 2.000 S/m           000111:         0.000 to 50.00 S/m           000211:         0.00 to 50.00 g/L           000211:         0.00 to 20.00 g/L           000211:         0 to 5000 mg/L	

Shinko Command			Data Item	Data	
<b>Туре</b> 50H/20H	Code 06H/03H	0005H	A11 type	When 10.0/cm is selected in [Sensor cell constant], and TDS conversion (g/L, mg/L) in [Measurement unit]:         0000H:       0 to 200 g/L         0001H:       0 to 500 g/L         0002H:       0 to 2000 g/L         When Seawater salinity (%) is selected in [Measurement unit]:         0000H:       0.00 to 4.00%         When NaCl salinity (%) is selected in [Measurement unit]:         0000H:       0.00 to 4.00%         When NaCl salinity (%) is selected in [Measurement unit]:         0000H:       0.00 to 20.00%         0000H:       No action         0002H:       Conductivity input low limit action         0002H:       Conductivity input high limit action         0002H:       Temperature input low limit action         0003H:       Temperature input high limit action         0005H:       Error output         0006H:       Fail output         0007H:       Conductivity input High/Low limits independent action         0008H:       Temperature input High/Low

## 11.7 Conductivity & Temperature Calibrations, Transmission Output 1 & 2 Adjustments

## via Communication Command

## 11.7.1 Conductivity Calibration

Cell constant may vary due to deterioration of the 4-electrode Conductivity Sensor.

To correct the varied cell constant, calibration must be performed.

Calibrate Conductivity Zero adjustment first, followed by Conductivity Span adjustment.

The following outlines the procedure for conductivity calibration.

## (1) Conductivity Zero adjustment

- <sup>①</sup> When selecting Last value HOLD (0000H) at Data item 010FH (Transmission output 1 status when calibrating) or 014DH (Transmission output 2 status when calibrating), select it while the 4-elctrode Conductivity Sensor is being immersed in the solution currently measured.
- ② At this stage, do not immerse the 4-elctrode Conductivity Sensor in the standard solution.
- (3) Set Data item 0042H (Conductivity calibration mode) to 0001H. The unit moves to Conductivity calibration Zero adjustment mode. If 2<sup>13</sup>, 2<sup>12</sup> digits are read at Data item 0081H (Status flag 1), 01 (During Conductivity calibration Zero adjustment mode) will be returned.
- ④ Set the Conductivity Zero adjustment value at Data item 0043H (Conductivity Zero adjustment value) so that conductivity becomes 0 (zero).
  - When conductivity is 0 (zero), it is not necessary to adjust.
- (5) Set Data item 0042H (Conductivity calibration mode) to 0000H. Conductivity Zero adjustment is complete, and the unit will revert to Conductivity/Temperature Display Mode.

## (2) Conductivity Span adjustment

- ① Immerse the 4-elctrode Conductivity Sensor in the standard solution.
- Set Data item 0042H (Conductivity calibration mode) to 0002H.
   The unit moves to Conductivity calibration Span adjustment mode.
   If 2<sup>13</sup>, 2<sup>12</sup> digits are read at Data item 0081H (Status flag 1), 10 (During Conductivity calibration Span adjustment mode) will be returned.
- <sup>③</sup> Set the Conductivity Span adjustment value at Data item 0044H (Conductivity Span adjustment value), while checking the conductivity.
- Set Data item 0042H (Conductivity calibration mode) to 0000H.
   Conductivity Span adjustment is complete, and the unit will revert to Conductivity/Temperature Display Mode.

If Conductivity calibration cannot be performed while calibrating conductivity due to temperature compensation error, Conductivity measurement value error, etc., Error code 1 (Burnout, Shortcircuited, etc.) will be returned after 2<sup>0</sup> to 2<sup>5</sup> digits are read at Data item 0081H (Status flag 1). To cancel the error code, set Data item 0042H (Conductivity calibration mode) to 0000H. The unit will revert to Conductivity/Temperature Display Mode.

If Conductivity Zero/Span adjustment value is set at Data item 0043H (Conductivity Zero adjustment value) or 0044H (Conductivity Span adjustment value) in Conductivity/Temperature Display Mode, the following error code will be returned.

- Shinko protocol: Error code 34H
- MODBUS protocol: Exception code 11H

#### 11.7.2 Temperature Calibration

Temperature calibration is performed by setting temperature calibration value.

The following outlines the procedure for Temperature calibration.

① Set Data item 0040H (Temperature calibration mode) to 0001H. The unit moves to Temperature calibration mode.

If 2<sup>13</sup>, 2<sup>12</sup> digits are read at Data item 0091H (Status Flag 2), 01 (During temperature calibration) will be returned.

- <sup>(2)</sup> Set the Temperature calibration value at Data item 0041H (Temperature calibration value), while checking the temperature.
- <sup>③</sup> Set Data item 0040H (Temperature calibration mode) to 0000H. Temperature calibration is complete, and the unit will revert to Conductivity/Temperature Display Mode.

If Temperature calibration cannot be performed while calibrating temperature due to input error, calibration value error, etc., Error code 1 (Burnout, Short-circuited, etc.) will be returned after  $2^0$  to  $2^5$  digits are read at Data item 0081H.

To cancel the error code, set Data item 0040H (Temperature calibration mode) to 0000H. The unit will revert to Conductivity/Temperature Display Mode.

If Temperature calibration value is set at Data item 0041H (Temperature calibration value) in Conductivity/Temperature Display Mode, the following error code will be returned.

Shinko protocol: Error code 34H MODBUS protocol: Exception code 11H

#### 11.7.3 Transmission Output 1 Adjustment

Fine adjustment of Transmission output 1 is performed.

This instrument is adjusted at the factory, however, differences may occur between the indication value of the connected equipment (recorders, etc.) and output value of this instrument. In this case, perform Transmission output 1 Zero and Span adjustments.

The following outlines the procedure for Transmission output 1 adjustment.

- Set Data item 0126H (Transmission output 1 adjustment mode) to 0001H. The unit moves to Transmission output 1 Zero adjustment mode. If 2<sup>5</sup>, 2<sup>4</sup> digits are read at Data item 0091H (Status flag 2), 01 (During Transmission output 1 Zero adjustment in Transmission output 1 adjustment mode) will be returned.
- <sup>(2)</sup> Set the Transmission output 1 Zero adjustment value at Data item 0127H (Transmission output 1 Zero adjustment value), while viewing the value indicated on the connected equipment (recorders, etc.).

Setting range: ±5.00% of Transmission output 1 span

- <sup>(3)</sup> Set Data item 0126H (Transmission output 1 adjustment mode) to 0002H. The unit moves to Transmission output 1 Span adjustment mode. If 2<sup>5</sup>, 2<sup>4</sup> digits are read at Data item 0091H (Status flag 2), 10 (During Transmission output 1 Span adjustment in Transmission output 1 adjustment mode) will be returned.
- ④ Set Transmission output 1 Span adjustment value at Data item 0128H (Transmission output 1 Span adjustment value), while viewing the value indicated on the connected equipment (recorders, etc.).
  - Setting range: ±5.00% of Transmission output 1 span
- 5 Repeat steps 1 to 4 if necessary.
- <sup>(6)</sup> To finish Transmission output 1 adjustment, set Data item 0126H (Transmission output 1 adjustment mode) to 0000H.

The unit reverts to Conductivity/Temperature Display Mode.

### 11.7.4 Transmission Output 2 Adjustment

Fine adjustment of Transmission output 2 is performed.

This instrument is adjusted at the factory, however, differences may occur between the indication value of the connected equipment (recorders, etc.) and output value of this instrument. In this case, perform Transmission output 2 Zero and Span adjustments.

The following outlines the procedure for Transmission output 2 adjustment.

- Set Data item 014AH (Transmission output 2 adjustment mode) to 0001H. The unit moves to Transmission output 2 Zero adjustment mode. If 2<sup>9</sup>, 2<sup>8</sup> digits are read at Data item 0091H (Status flag 2), 01 (During Transmission output 2 Zero adjustment in Transmission output 2 adjustment mode) will be returned.
- <sup>(2)</sup> Set the Transmission output 2 Zero adjustment value at Data item 014BH (Transmission output 2 Zero adjustment value), while viewing the value indicated on the connected equipment (recorders, etc.).
  - Setting range: ±5.00% of Transmission output 2 span
- <sup>(3)</sup> Set Data item 014AH (Transmission output 2 adjustment mode) to 0002H. The unit moves to Transmission output 2 Span adjustment mode. If 2<sup>9</sup>, 2<sup>8</sup> digits are read at Data item 0091H (Status flag 2), 10 (During Transmission output 2 Span adjustment in Transmission output 2 adjustment mode) will be returned.
- ④ Set Transmission output 2 Span adjustment value at Data item 014CH (Transmission output 2 Span adjustment value), while viewing the value indicated on the connected equipment (recorders, etc.).

Setting range: ±5.00% of Transmission output 2 span

- $^{(5)}$  Repeat steps  $^{(1)}$  to  $^{(4)}$  if necessary.
- <sup>(6)</sup> To finish Transmission output 2 adjustment, set Data item 014AH (Transmission output 2 adjustment mode) to 0000H.

The unit reverts to Conductivity/Temperature Display Mode.

#### 11.8 Notes on Programming Monitoring Software

#### 11.8.1 How to Speed up the Scan Time

When monitoring multiple units of the WIL-102-ECH, set the program so that the requisite minimum pieces of data such as Data item 0080H (Conductivity), Data item 0090H (Temperature), Data item 0081H (Status flag 1), Data item 0091H (Status flag 2) can be read.

For other data, set the program so that they can be read only when their set value has been changed. This will speed up the scan time.

#### 11.8.2 How to Read the Set Value Changes Made by Front Keypad Operation

If any set value is changed by keypad operation, the instrument sets [0081H (Status flag 1) 2<sup>15</sup>: Change in key operation] to 1 (Yes).

There are 2 methods of reading the set value changes made by the front keypad.

#### (1) Reading Method 1

- <sup>(1)</sup> On the monitoring software side, check that [0081H (Status flag 1) 2<sup>15</sup>: Change in key operation] has been set to 1 (Yes), then read all set values.
- <sup>(2)</sup> Clear [0081H (Status flag 1) 2<sup>15</sup>: Change in key operation], by setting Data item 007FH (Key operation change flag clearing) to 0001H (Clear change flag).

If 007FH (Key operation change flag clearing) is set to 0001H (Clear change flag) during the setting mode of the instrument, Error code 5 (35H, Shinko protocol) or Exception Code 18 (12H, MODBUS protocol) will be returned as a negative acknowledgement. And [0081H (Status flag 1) 2<sup>15</sup>: Change in key operation] cannot be cleared.

Set a program so that all set values can be read when a negative acknowledgement is returned.

<sup>(3)</sup> Read all set values again after acknowledgement is returned.

#### (2) Reading Method 2

- <sup>(1)</sup> On the monitoring software side, check that [0081H (Status flag 1) 2<sup>15</sup>: Change in key operation] has been set to 1 (Yes), then set 007FH (Key operation change flag clearing) to 0001H (Clear change flag).
- <sup>(2)</sup> Set the program depending on the acknowledgement or negative acknowledgement as follows.

#### When acknowledgement is returned:

Consider it as settings completed, and read all set values.

# When Error code 5 (35H, Shinko protocol) or Exception code 18 (12H, MODBUS protocol) is returned as a negative acknowledgement:

Consider it as still in setting mode, and read the requisite minimum pieces of data such as 0080H (Conductivity), 0090H (Temperature), 0081H (Status flag 1), 0091H (Status flag 2), then return to step 1.

Thus, programs which do not affect the scan time can be created using the methods described above, even if set values on the monitoring software will not be updated until settings are complete.

#### 11.8.3 Note when Sending All Set Values Simultaneously

• If A type is changed at Data item 0005H (A11 type), 0050H (A12 type), 0051H (A21 type) or 0052H (A22 type), the A11, A12, A21 or A22 value will default to 0.00 or 0.0. Output status of A11, A12, A21 or A22 will also be initialized.

First, send the A11, A12, A21, A22 type, then send the A11, A12, A21, A22 value set at Data item 0006H (A11 value), 0053H (A12 value), 0054H (A21 value) and 0055H (A22 value).

Time Accuracy	Within ±1% of setting time			

### **Standard Functions**

Conductivity Calibration	Calibrate Conductivity Zero adjustment first, followed by Conductivity Span adjustment. However, if $\angle \Box \Box \downarrow'$ (Lock 1), $\angle \Box \Box \Box''$ (Lock 2) or $\angle \Box \Box \exists'$ (Lock 3) is selected in [Set value lock] (p.31), the unit cannot move to			
	Conductivity calibration mode.			
	In Conductivity Zero adjustment, adjustment is performed so that conductivity becomes 0, without immersing the 4-electrode Conductivity Sensor in the standard solution.			
	In Conductivity Span adjustment, the 4-electrode Conductivity Sensor is immersed and adjustment is performed while checking conductivity. However, it is effective within the input rated range regardless of the			
	adjustment value.			
Temperature Calibration	When a sensor cannot be set at the exact location where measurement is desired, the resulting measured temperature may deviate from the temperature in the desired location. In this case, the desired temperature can be set for the desired location by setting a temperature calibration value. However, it is effective within the input rated range regardless of the temperature calibration value.			

TD	S Conversion	TDS stands for Total Dissolved Solids. Conductivity of a solution results from the amount of salt, minerals or					
		dissolved gas. Conductivity is an index indicating the total amount of a substance solution, and TDS indicates only the amount of all dissolved substances.					
		TDS can be used correctly to compare the two solutions in which one ingredient, such as NaCl, is included. However, for comparison between a solution in which one ingredient such as NaCl is included and the other solution in which more than one ingredient is included, TDS error will occur.					
		TDS and conductivity are expressed with the following formula. For Conductivity SI unit (S/m, mS/m): TDS (g/L) = L (S/m) × K × 10					
		TDS (mg/L) =	. ,				
		For Conductivity	. ,				
		TDS $(g/L) = L$	•				
		TDS (mg/L) =	. ,

	Display	/ Cł	naracter	Input T	emperature fication (*)	Selection Iter Input Wire T		
	Temperat		r	Pt100		<i>F'I E</i> ′: 2-wire <i>F'I</i> ∃: 3-wire	type	
	Display	$P_{i}$	r 10	Pt1000				
	(*) This input temperature specification was specified at the time of ordering.					of ordering.		
Display Sleep Function	Conductivity, Temperature or No indication can be selected in [Display selection (p.34)], which is indicated in Conductivity/Temperature Display Mode. If Conductivity and/or Temperature is selected, and if indication time is set, the displays become unlit after the indication time has passed from no operation status. If any errors occur, or if any key is pressed, the display will re-light. If the indication time is set to 0, the display remains lit, and this function does not work.							
Auto-light Function	Automatically measures and controls brightness of the Conductivity Display, Temperature Display and action indicators.							
Cable Length Correction	If $P' [ ] c$ (2-wire type) is selected in [Pt100 input wire type (p. 30)], and if sensor cable is too long, temperature measurement error will occur due to cable resistance. This can be corrected by setting the cable length correction value and cable cross-section area.							
Error Code	The following error codes flash on the Temperature Display.							
	Error Code	Error Type		ror tents	Desc	ription	Occurrence	
	E-0 /	Fail	Temp. S burnout		Temperature wire is burnt			
	E-02	Fail	Temp. S short-ci		Temperature wire is short-		When measuring	
	8-03	Error	Outside comper	•	Measured te has exceede	•	or calibrating	
	E-04	Error	Outside comper	e temp.	Measured te is less than 0	mperature		
	(Abbreviation: Temp.: Temperature)							

## O<u>ther</u>

Power Consumption	Approx. 8 VA
Ambient Temperature	0 to 50°C (32 to 122°F)
Ambient Humidity	35 to 85 %RH (non-condensing)
Weight	Approx. 200 g (including the socket)
Accessories Included	Instruction manual: 1 copy
	Unit label: 1 sheet
Accessories Sold	Socket: ASK-001-1 (Finger-safe and screw fall prevention)
Separately	
Environmental	RoHS directive compliant
Specification	

# 12.2 Optional Specifications

A Output (Option Code: EVT or TA)

the Conductivity Display.		

• Grounding of shield wire terminal (E)

If the indication fluctuates due to noise, ground the shield wire terminal (E).

However, depending on the installation environment, the symptom may not be improved.

In this case, disconnect the grounding of the shield wire terminal (E) and return it to the original state. (Depending on the type of sensor, the cable for the shield wire terminal (E) may not be available.)

### 13.2 Key Operation

# **14. Temperature Compensation Method**

# 14.1 Temperature Compensation Based on the Temperature Characteristics of NaCI

When the main ingredient of the salt contained in a sample is NaCl, use temperature compensation method based on the temperature characteristics of NaCl.

Conductivity of NaCl solution varies with the ratio based on the conductivity at  $25^{\circ}$ C as shown below. The conductivity at  $25^{\circ}$ C is calculated on the basis of the conductivity ratio at each temperature in (Table 14.1-1).

(Table 14.1-1)						
Tempera-	Conductivity	Coeffi-				
ture (°C)	ratio of NaCI	cient				
0	0.542	1.845				
5	0.626	1.596				
10	0.715	1.399				
15	0.806	1.240				
20	0.902	1.109				
25	1.000	1.000				
30	1.101	0.908				
35	1.205	0.830				
40	1.312	0.762				
45	1.420	0.704				
50	1.531	0.653				
55	1.643	0.609				
60	1.757	0.569				
65	1.872	0.534				
70	1.987	0.503

95	2.564	0.390				
100	2.677	0.374				

(Fig.14.1-1)

### 14.2 How to Input Temperature Coefficient

Temperature compensation is conducted using temperature coefficient (%/ $^{\circ}$ C) and a randomly selected reference temperature.

Conductivity of the solution varies depending on the temperature.

If temperature rises by 1°C, the conductivity rises by 2% at 25°C basis in general.

Temperature coefficient differs depending on the solution type and its concentration, which ranges from 0.50 to 2.50.

By inputting the temperature coefficient, temperature compensation can be calculated to find the conductivity at  $25^{\circ}$ .

Temperature coefficient 2.00 %/ $^{\circ}$  can be used for most of solutions.

If temperature coefficient of solution is already-known, enter the value. (Table 14.2-1)

If the conductivity at an arbitrary temperature  $T^{\circ}C$  is already-known, and if reference temperature is  $ST^{\circ}C$ , conductivity  $C_{(ST)}$  at the reference temperature can be obtained according to the following formula.

$$C_{(ST)} = \frac{C_{(T)}}{(1 + 0.01 \times \alpha \times (T - ST))}$$

 $C_{(ST)}$ : Conductivity of the solution at  $ST^{\circ}C$ 

 $C_{(T)}$ : Conductivity of the solution at T<sup>°</sup>C

- $\alpha$ : Temperature coefficient of conductivity (%)
- *T*: Arbitrary temperature  $T^{\circ}C$
- ST: Reference temperature ST<sup>°</sup>C

(\*) The time unit depends on the selection in [Conductivity input error alarm time unit].

\*\*\*\*\* Inquiries \*\*\*\*\*

For any inquiries about this unit, please contact our agency or the vendor where you purchased the unit after checking the following.

[Example]

• Model ----- WIL-102-ECH

• Serial number ----- No. 195F05000

In addition to the above, please let us know the details of the malfunction, or discrepancy, and the operating conditions.
